Chapter 12, Lesson C: Divide 2-Digit Numbers by 2, 3, 4 and 5 (12.C.1)

- **Division** is dividing a number into equal parts or sharing it equally.

- A division number sentence consists of:

$$\begin{array}{ccccccc} \text{dividend} & \div & \text{divisor} & = & \text{quotient} \\ 24 & \div & 3 & = & 8 \end{array}$$

$$\begin{array}{ccccccc} \text{dividend} & \div & \text{divisor} & = & \text{quotient} & \text{and remainder} \\ 25 & \div & 3 & = & 8 & \text{R } 1 \end{array}$$

- If the dividend is a **multiple** of the divisor, there will be no remainder.

$$16 \div 2 = \underline{8} \qquad 21 \div 3 = \underline{7} \qquad 56 \div 8 = \underline{7}$$

- If the dividend is **not a multiple** of the divisor, there will be a remainder.
We count back till we reach the closest multiple.

remainder = dividend - closest smaller multiple of the divisor

The remainder is always **less** than the divisor.

remainder < divisor

$$\begin{array}{c} 17 \div 2 = \underline{8} \text{ R } 1 \\ \swarrow \quad \searrow \\ 16 \quad 1 \end{array}$$

$1 < 2$ so $\text{R} = 1$

$16 \div 2 = 8$

$$\begin{array}{c} 23 \div 3 = \underline{7} \text{ R } 2 \\ \swarrow \quad \searrow \\ 21 \quad 2 \end{array}$$

$2 < 3$ so $\text{R} = 2$

$21 \div 3 = 7$

- If the dividend is **greater than the tenth multiple** of the divisor, we break down the number into two multiples of the divisor.

$$\begin{array}{c}
 48 \div 4 = 12 \\
 \swarrow \quad \searrow \\
 40 \quad 8 \\
 40 \div 4 = 10 \\
 8 \div 4 = 2 \\
 \hline
 10 + 2 = 12
 \end{array}$$

- We can solve the following using different number bonds.

$$\begin{array}{c}
 85 \div 5 = 17 \\
 \swarrow \quad \searrow \\
 50 \quad 35
 \end{array}$$

$$\begin{array}{l}
 50 \div 5 = 10 \\
 35 \div 5 = 7 \\
 10 + 7 = 17
 \end{array}$$

$$\begin{array}{c}
 85 \div 5 = 17 \\
 \swarrow \quad \searrow \\
 40 \quad 45
 \end{array}$$

$$\begin{array}{l}
 40 \div 5 = 8 \\
 45 \div 5 = 9 \\
 8 + 9 = 17
 \end{array}$$

$$\begin{array}{c}
 85 \div 5 = 17 \\
 \swarrow \quad \searrow \\
 55 \quad 30
 \end{array}$$

$$\begin{array}{l}
 55 \div 5 = 11 \\
 30 \div 5 = 6 \\
 11 + 6 = 17
 \end{array}$$

- If the dividend is not a multiple of the divisor and greater than the 10th or 11th multiple of the divisor, we count back till we reach the closest multiple.

$$\begin{array}{c}
 23 \div 2 = 11 \text{ R } 1 \\
 \swarrow \quad \searrow \\
 22 \quad 1 \\
 22 \div 2 = 11 \\
 1 < 2 \text{ so R} = 1
 \end{array}$$

$$\begin{array}{c}
 54 \div 5 = 10 \text{ R } 4 \\
 \swarrow \quad \searrow \\
 50 \quad 4 \\
 50 \div 5 = 10 \\
 4 < 5 \text{ so R} = 4
 \end{array}$$

23 is an odd number so it is not a multiple of 2.
Multiples of 2 are all even numbers.
We go back to the 2 times table.

$$10 \times 2 = 20$$

$$11 \times 2 = 22$$

→ 23 is between 22 and 24.

12 \times 2 = 24 We choose the smaller multiple

which is 22: $11 \times 2 = 22$

The difference between 23 and 22 is 1. So the remainder is 1.

54 is not a multiple of 5. Multiples of 5 have 0 or 5 in the ones place. We go back to 5 times table.

$$10 \times 5 = 50$$

$$11 \times 5 = 55$$

→ 54 is between 50 and 55.

We choose the smaller multiple which is 50: $10 \times 5 = 50$

The difference between 54 and 50 is 4. So the remainder is 4.

More examples:

$$\begin{array}{c} \textcircled{29} \\ \swarrow \searrow \\ \textcircled{27} \quad \textcircled{2} \end{array} \div 3 = \underline{9 \text{ R} 2}$$

$2 < 3$ so R = 2

$$27 \div 3 = \underline{9}$$

$$\begin{array}{c} \textcircled{33} \\ \swarrow \searrow \\ \textcircled{32} \quad \textcircled{1} \end{array} \div 4 = \underline{8 \text{ R} 1}$$

$1 < 4$ so R = 1

$$32 \div 4 = \underline{8}$$

29 is not a multiple of 3. We go back to 3 times table.

$$8 \times 3 = 24$$

$$9 \times 3 = 27$$

→ 29 is between 27 and 30.

10 \times 3 = 30 We choose the smaller multiple which is 27:

$$9 \times 3 = 27$$

The difference between 29 and 27 is 2. So the remainder is 2.

33 is an odd number so it is not a multiple of 4. Multiples of 4 are all even numbers. We go back to the 4 times table.

$$8 \times 4 = 32$$

$$9 \times 4 = 36$$

→ 33 is between 32 and 36.

We choose the smaller multiple which is 32: $8 \times 4 = 32$

The difference between 33 and 32 is 1. So the remainder is 1.
