

## Look Back

Look at the shapes on Eddy's shirt.  
How many straight sides and curved sides are there in each shape?

*There is a triangle and a circle.*

*There are 3 straight sides in the triangle and a curved line in the circle.*

## Thinking Cap

Compare the shapes on Eddy's ball to the ones on his shirt.

What is the same and what is different?

Find similar shapes around you to help you.

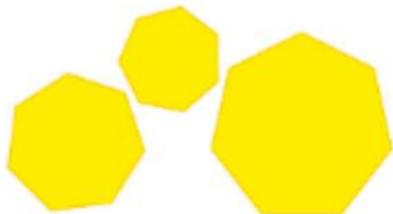

Look at the ball:

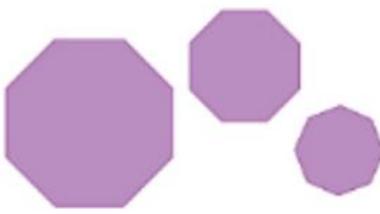

• The pentagon and the hexagon are 2D shapes.

A pentagon has 5 straight sides and a hexagon has 6 straight sides.

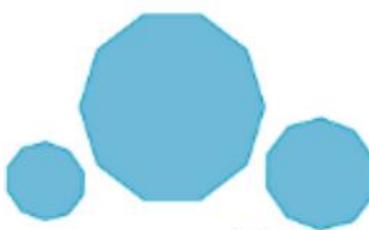

A heptagon has 7 sides and  
7 vertices.

An octagon has 8 sides and  
8 vertices.

A nonagon has 9  
sides and 9 vertices.

A decagon has 10  
sides and 10 vertices.

What do you notice about  
the number of sides and  
vertices in each polygon?

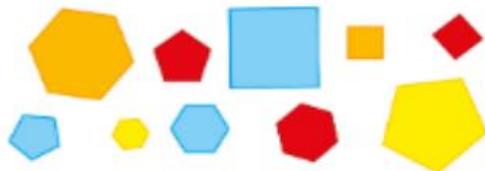

The number of sides is equal to the number of vertices in each polygon.

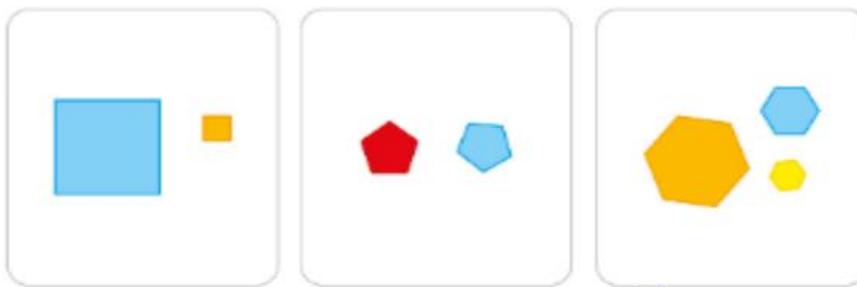

*In polygons,*  
number of **sides** = number of **vertices**

p. 79

b Izzy wants to sort the shapes into groups.

Get shape stickers from page 248 to help you.

The 2D shapes are sorted by the number of sides and vertices

What other ways can you group the shapes into?

colour and size

## Let's Practise

I Write "true" or "false".

Figure A

Figure B

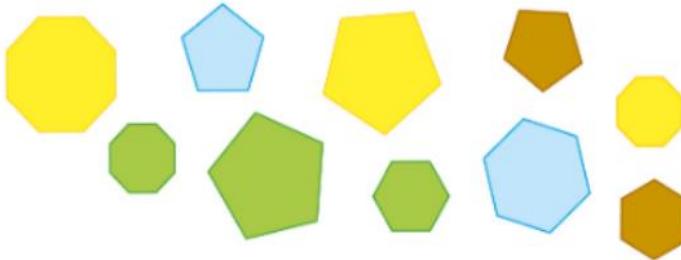

Figure C

- a Figure A is a polygon with 6 equal sides. false
- b Figure B is the odd one out. true
- c Figure C is a hexagon. true

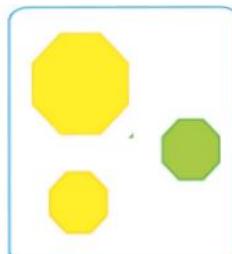

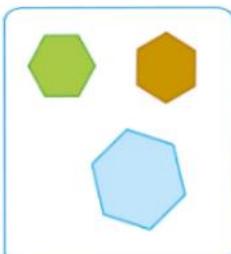

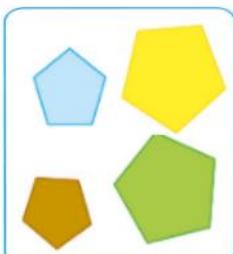

2 Ali sorts the polygons below into groups.

Get stickers from page 249 to help you.

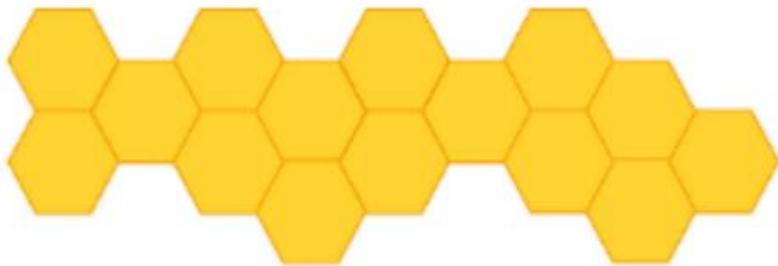

80

How are the polygons sorted? shapes

3 Wei Ming makes a pattern.

Draw four more hexagons to continue the pattern.

Why do you think these shapes fit nicely without any gaps?
